1.	Which notation would you use to denote the 3rd layer's activations when the input is the 7th example from the 8th minibatch?	1 / 1 point
	$igcap a^{[8]\{3\}(7)}$	
	$igcap a^{[3]\{7\}(8)}$	
	$igo a^{[3]\{8\}(7)}$	
	$\bigcap \ a^{[8]\{7\}(3)}$	
	✓ Correct	
2.	Which of these statements about mini-batch gradient descent do you agree with?	1 / 1 point
	One iteration of mini-batch gradient descent (computing on a single mini-batch) is faster than one iteration of batch gradient descent.	
	O You should implement mini-batch gradient descent without an explicit for-loop over different mini-batches, so that the algorithm processes all mini-batches at the same time (vectorization).	
	Training one epoch (one pass through the training set) using mini-batch gradient descent is faster than training one epoch using batch gradient descent.	;
	✓ Correct	

If the mini-batch size is 1, you lose the benefits of vectorization across examples in the mini-batch.

4. Suppose your learning algorithm's cost J, plotted as a function of the number of iterations, looks like this:

1 / 1 point

- If you're using mini-batch gradient descent, this looks acceptable. But if you're using batch gradient descent, something is wrong.
  Whether you're using batch gradient descent or mini-batch gradient descent, this looks acceptable.
  If you're using mini-batch gradient descent, something is wrong. But if you're using batch gradient descent, this looks acceptable.
  Whether you're using batch gradient descent or mini-batch gradient descent, something is
  - ✓ Correct

wrong.

5. Suppose the temperature in Casablanca over the first three days of January are the same:

1 / 1 point

Jan 1st: 
$$heta_1=10^oC$$

Jan 2nd: 
$$heta_2 10^o C$$

(We used Fahrenheit in lecture, so will use Celsius here in honor of the metric world.)

Say you use an exponentially weighted average with  $\beta=0.5$  to track the temperature:  $v_0=0$ ,  $v_t=\beta v_{t-1}+(1-\beta)\theta_t$ . If  $v_2$  is the value computed after day 2 without bias correction, and  $v_2^{corrected}$  is the value you compute with bias correction. What are these values? (You might be able to do this without a calculator, but you don't actually need one. Remember what is bias correction doing.)

- $\bigcirc \ v_2 = 7.5, v_2^{corrected} = 7.5$
- $igcup v_2=10$ ,  $v_2^{corrected}=7.5$
- $\bigcirc \ v_2=10$ ,  $v_2^{corrected}=10$
- $igotimes v_2 = 7.5$  ,  $v_2^{corrected} = 10$

6. Which of these is NOT a good learning rate decay scheme? Here, t is the epoch number.

$\bigcirc$	~ —	1_0	0/-	
$\cup$	α	_	$\frac{1}{1+2*t}\alpha$	0

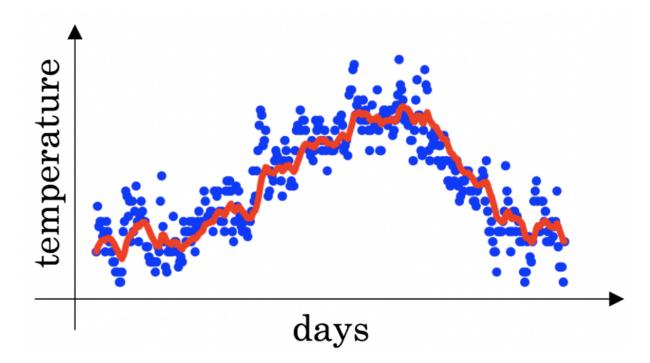

$$\bigcirc \ \alpha = 0.95^t \alpha_0$$

$$\bigcap \ \alpha = \frac{1}{\sqrt{t}}\alpha_0$$

/	Correct
~	

7. You use an exponentially weighted average on the London temperature dataset. You use the following to track the temperature:  $v_t=\beta v_{t-1}+(1-\beta)\theta_t$ . The red line below was computed using  $\beta=0.9$ . What would happen to your red curve as you vary  $\beta$ ? (Check the two that apply)

1 / 1 point

 $\square$  Decreasing  $\beta$  will shift the red line slightly to the right.

Increasing  $\beta$  will shift the red line slightly to the right.

## ✓ Correct

True, remember that the red line corresponds to  $\beta=0.9$ . In lecture we had a green line \$\$\beta=0.98\$) that is slightly shifted to the right.

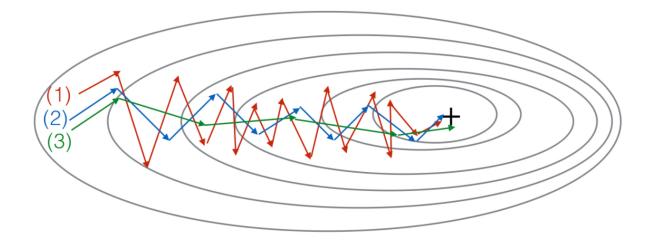

- Decreasing  $\beta$  will create more oscillation within the red line.
  - **/**

#### Correct

True, remember that the red line corresponds to  $\beta=0.9$ . In lecture we had a yellow line \$\$\beta=0.98\$ that had a lot of oscillations.

- 8. Consider this figure:

1/1 point

These plots were generated with gradient descent; with gradient descent with momentum ( $\beta$  = 0.5) and gradient descent with momentum ( $\beta$  = 0.9). Which curve corresponds to which algorithm?

- (1) is gradient descent with momentum (small  $\beta$ ), (2) is gradient descent with momentum (small  $\beta$ ), (3) is gradient descent
- (1) is gradient descent with momentum (small  $\beta$ ). (2) is gradient descent. (3) is gradient descent with momentum (large  $\beta$ )
- (1) is gradient descent. (2) is gradient descent with momentum (small  $\beta$ ). (3) is gradient descent with momentum (large  $\beta$ )
- (1) is gradient descent. (2) is gradient descent with momentum (large  $\beta$ ) . (3) is gradient descent with momentum (small  $\beta$ )

Correct

	all that apply)	
	lacksquare Try tuning the learning rate $lpha$	
	✓ Correct	
	✓ Try mini-batch gradient descent	
	✓ Correct	
	Try better random initialization for the weights	
	✓ Correct	
	✓ Try using Adam	
	✓ Correct	
	Try initializing all the weights to zero	
10	. Which of the following statements about Adam is False?	1 / 1 point
	igcup The learning rate hyperparameter $lpha$ in Adam usually needs to be tuned.	
	Adam should be used with batch gradient computations, not with mini-batches.	
	O We usually use "default" values for the hyperparameters $eta_1,eta_2$ and $arepsilon$ in Adam ( $eta_1=0.9$ , $eta_2=0.999$ , $arepsilon=10^{-8}$ )	
	Adam combines the advantages of RMSProp and momentum	
	✓ Correct	

the following techniques could help find parameter values that attain a small value for  $\mathcal{J}$  ? (Check
